

Advances in Mental Health Stigma Reduction

Joseph S. DeLuca, Ph.D.

Fairfield University

May 3, 2023

MHTTC

Mental Health Technology Transfer Center Network

Funded by Substance Abuse and Mental Health Services Administration

The purpose of the MHTTC Network is technology transfer - disseminating and implementing evidence-based practices for mental disorders into the field.

Funded by the Substance Abuse and Mental Health Services Administration (SAMHSA), the MHTTC Network includes 10 Regional Centers, a National American Indian and Alaska Native Center, a National Hispanic and Latino Center, and a Network Coordinating Office.

Our collaborative network supports resource development and dissemination, training and technical assistance, and workforce development for the mental health field. We work with systems, organizations, and treatment practitioners involved in the delivery of mental health services to strengthen their capacity to deliver effective evidence-based practices to individuals. Our services cover the full continuum spanning mental illness prevention, treatment, and recovery support.

The MHTTC Network uses affirming, respectful and recovery-oriented language in all activities. That language is:

STRENGTHS-BASED
AND HOPEFUL

INCLUSIVE AND
ACCEPTING OF
DIVERSE CULTURES,
GENDERS,
PERSPECTIVES,
AND EXPERIENCES

HEALING-CENTERED AND
TRAUMA-RESPONSIVE

INVITING TO INDIVIDUALS
PARTICIPATING IN THEIR
OWN JOURNEYS

PERSON-FIRST AND
FREE OF LABELS

NON-JUDGMENTAL AND
AVOIDING ASSUMPTIONS

RESPECTFUL, CLEAR
AND UNDERSTANDABLE

CONSISTENT WITH
OUR ACTIONS,
POLICIES, AND PRODUCTS

Learning objectives

- Describe the research evidence of *how stigma impacts people with mental health conditions worldwide*
- *Conceptualize and define stigma, particularly as it pertains to mental health (MH) and intersectionality*
- Discuss efforts to *combat stigma on societal and individual levels*

Agenda

- 1. What is stigma?**
- 2. How does mental health stigma impact people?**
- 3. How do we conceptualize and study mental health stigma?**
- 4. How can we combat stigma?**
- 5. Summary & Q&A**

Agenda

1. What is stigma?

2. How does mental health stigma impact people?

3. How do we conceptualize and study mental health stigma?

4. How can we combat stigma?

5. Summary & Q&A

Stigma

- **How do you define it?**

Source: Pixabay

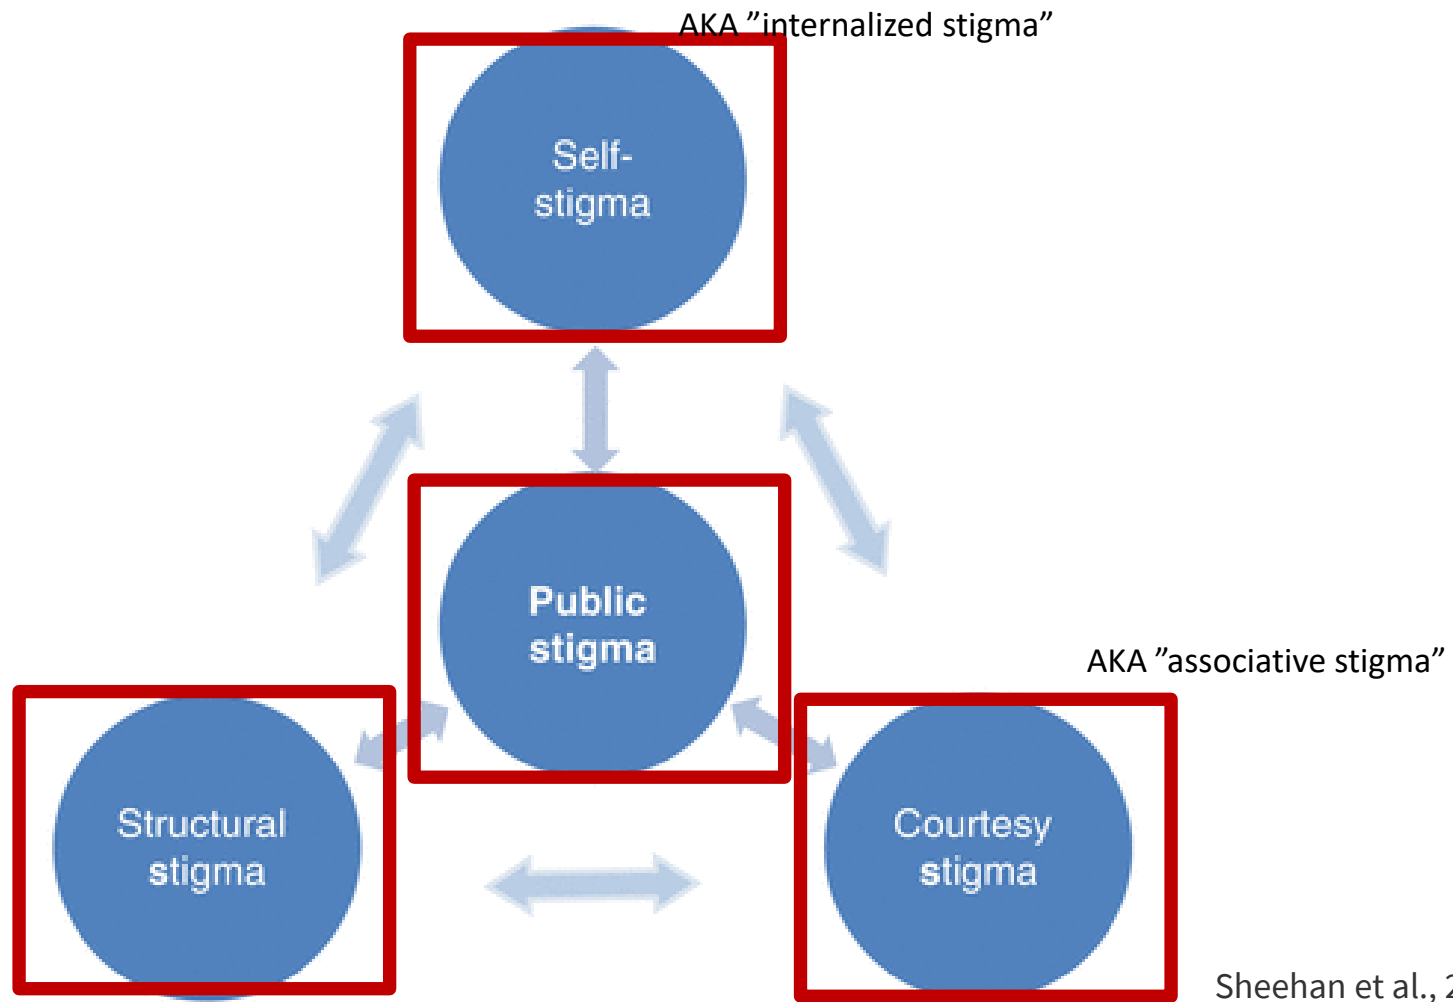

Stigma (continued)

- A process of assigning labels to people (Link & Phelan, 2001; Pescosolido & Martin, 2015)
- These labels gain power when linked to stereotypes (e.g., dangerousness, weakness) and prejudice (endorsement of stereotypes)
- Labels + stereotypes/prejudice = discrimination
- Also: “spoiled identity” (Goffman, 1963)
 - **Implications for youth and those with heavily stigmatized MH conditions (e.g., psychosis-spectrum experiences)*

Stigma (continued)

- A public health and social justice issue (Corrigan et al., 2005; Yanos, 2018)
- Multiple dimensions (e.g., negative stereotypes, social distance, discrimination)

Sheehan et al., 2016

Agenda

1. What is stigma?

2. How does mental health stigma impact people?

3. How do we conceptualize and study mental health stigma?

4. How can we combat stigma?

5. Summary & Q&A

The human impact of stigma

- **Many people living with MH conditions say that stigma can be worse than the MH symptoms** (Thornicroft et al., 2022)
 - e.g., laws and policies (loss of property, rights to vote), citizenship, marital prospects, social exclusion (school, work, community), poorer healthcare access & experiences, lower quality of life, poor MH treatment experiences, etc.
- Perceptions of stigma for seeking help and self-stigma (AKA internalized stigma) are linked to decreased help-seeking and poor recovery outcomes (Vogel et al., 2013; Yanos et al., 2008)

Poem 4

My own private nightmare

by Camilla Fitzjohn

Hard to believe it.
Where am I
What have I suddenly become. I've plummeted,
Can I sink any lower?

Labelled Mentally Ill, put and contained
A mental straight jacket. I can barely stand up,
I cannot read
My eyesight is blurred.

The nurses are kind,
But I have an inner sadness
Longing for the outside.
I decide
If I leave now, this won't count,
It will be just a nightmare.
"Leave now and you will be sectioned" I stay.

Medication makes me fat.
Slow and dull witted.
Labelled self-indulgent by my Professor.
Nerve endings tingling with humiliation.

Feel alone and cold.
Stuck on a private island
Nobody wants to visit.
Backs are turned.
Hostile stares.
No one sees the real me.
What's under this cloak of insanity.

Getting used to being ignored.
Settling for being misunderstood.

Hurrah!! How I cheer
for this new brave thoughtful generation!!

Thank you!! Thank you!!
For supporting and tolerating minorities.

Liberating us.
Cancelling Prejudice.

Thank you, New World.

ORIGINAL ARTICLE

Association between public views of mental illness and self-stigma among individuals with mental illness in 14 European countries

S. Evans-Lacko^{1*}, E. Brohan¹, R. Mojtabai^{2†} and G. Thornicroft^{1†}

¹ *Health Service and Population Research Department, Institute of Psychiatry, King's College London, UK*

² *Department of Mental Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA*

Background. Little is known about how the views of the public are related to self-stigma among people with mental health problems. Despite increasing activity aimed at reducing mental illness stigma, there is little evidence to guide and inform specific anti-stigma campaign development and messages to be used in mass campaigns. A better understanding of the association between public knowledge, attitudes and behaviours and the internalization of stigma among people with mental health problems is needed.

Method. This study links two large, international datasets to explore the association between public stigma in 14 European countries (Eurobarometer survey) and individual reports of self-stigma, perceived discrimination and empowerment among persons with mental illness ($n=1835$) residing in those countries [the Global Alliance of Mental Illness Advocacy Networks (GAMIAN) study].

Results. Individuals with mental illness living in countries with less stigmatizing attitudes, higher rates of help-seeking and treatment utilization and better perceived access to information had lower rates of self-stigma and perceived discrimination and those living in countries where the public felt more comfortable talking to people with mental illness had less self-stigma and felt more empowered.

Conclusions. Targeting the general public through mass anti-stigma interventions may lead to a virtuous cycle by disrupting the negative feedback engendered by public stigma, thereby reducing self-stigma among people with mental health problems. A combined approach involving knowledge, attitudes and behaviour is needed; mass interventions that facilitate disclosure and positive social contact may be the most effective. Improving availability of information about mental health issues and facilitating access to care and help-seeking also show promise with regard to stigma.

Received 26 July 2011; Revised 11 October 2011; Accepted 13 October 2011; First published online 16 November 2011

Key words: Attitudes, behaviour, mental disorders, social change, stigmatization.

Stigma and youth MH/treatment

- Systematic review with young people (age 12-25; Gulliver, Griffiths, & Christensen, 2010) concluded that perceived stigma, problems recognizing symptoms, and embarrassment (about getting help) were the most prominent barriers to help-seeking for mental health problems among young individuals.
- Meta-analysis of older adolescents' (university students; Nam et al., 2013) help-seeking attitudes found that internalized stigma in particular had one of the largest effect sizes on help-seeking
- Another systematic review (Clement et al., 2015) indicated that internalized stigma and anticipated stigma were the stigma dimensions that had the most disproportionate effect on help-seeking for young people (age <18) and individuals from ethnic minority groups

Agenda

1. What is stigma?
2. How does mental health stigma impact people?
- 3. How do we conceptualize and study mental health stigma?**

5. Summary & Q&A

Conceptualizing Stigma

Annual Review of Sociology

Vol. 27:363-385 (Volume publication date August 2001)

<https://doi.org/10.1146/annurev.soc.27.1.363>

- *Interrelated components*
- Distinguishing and labeling differences
- Associating human differences with negative attributes
- Separating “us” from “them”
- Status loss and discrimination
- Dependence of stigma on power

Conceptualizing stigma (continued)

Another, more recent guiding theory and conceptualization – the “stigma complex” (Pescosolido & Martin, 2015, p. 101):

*“the set of interrelated, heterogeneous system structures, from the individual to the society, and processes, from the molecular to the geographic and historical, that constructs, labels, **and translates difference into marks**” (bold added by me)*

Conceptualizing stigma (continued)

Blind spots in stigma research? Broadening our perspective on mental illness stigma by exploring 'what matters most' in modern Western societies

G. Schomerus¹  and M. C. Angermeyer²

¹Department of Psychiatry and Psychotherapy, University of Leipzig Medical Center, Leipzig, Germany and ²Center for Public Mental Health, Gösing am Wagram, Austria

Abstract

Aims. The theory of 'what matters most' (WMM) has been developed to understand differences in mental illness stigma between cultures, postulating that stigma becomes most pervasive in situations that matter most in a specific cultural context. The rise of populism in Western societies demonstrates that also within one cultural context, different values 'matter most' to different groups. We expand the WMM framework to explore the spectrum of stigma

Conceptualizing stigma: *multiple dimensions*

Sheehan et al., 2016

Stigma dimensions

- At the most basic level, stigma involves: labeling (e.g., “mentally ill,” “crazy”) + stereotyping (e.g., “unemployable,” “violent”) (Goffman, 1963) (e.g., ***public stigma***)
- --> *Discrimination, reduced social status...*

Stigma dimensions (continued)

- Stigma also manifests in power dynamics and institutional policies and laws (***structural stigma***)—which can contribute to status loss and discrimination
- + internalizations of negative stereotypes by individuals who are thinking about seeking MH treatment/in treatment/diagnosed (***e.g., self- or internalized stigma***)

Stigma dimensions (continued)

- ***Courtesy or associative stigma*** - extended to people who are close to the person who is stigmatized.
- Most commonly reported by friends and family members

What is the current context of MH stigma?

Stigma context: brief history

(Credit: NY Daily News via Getty Images Copyright: 1999/Daily News, L.P. [New York])

Assaultive and belligerent?

Cooperation often begins with HALDOL (haloperidol)
a first choice for starting therapy

Acts promptly to control aggressive, assaultive behavior

Several studies have reported the rapid effectiveness of HALDOL (haloperidol) in controlling aggressive and dangerously unstable behavior. "Even the threat of visible assault is averted by a group of criminal subjects 'resistant to maximal doses of phenothiazines' was almost substantially during treatment with HALDOL." Optimum control can be achieved rapidly, frequently within a few days when the intramuscular form used for initial control of acutely agitated psychotic states."

Usually leaves patients relatively alert and responsive

Although some instances of drowsiness have been observed, marked sedation with HALDOL (haloperidol) is rare. In a report on a study with criminal psychotics the investigators state, "The patients remained alert and more amenable to psychotherapeutic intervention." Another investigator reports that HALDOL "normalizes" behavior and produces a sensitivity to the environment that allows more effective use of the social milieu and the therapeutic community."

Reduces risk of serious adverse reactions

HALDOL (haloperidol), a butyrophenone, avoids or minimizes many of the problems associated with the phenothiazines. Hypertension is rare and severe orthostatic hypotension has not been reported. There is also less likelihood of adverse reactions such as liver damage, ocular changes, serious hematologic reactions and skin rashes. The most frequent side effects of HALDOL (haloperidol) — occupational symptoms — are usually dose-related and readily controlled.

What is the prevalence of MH stigma?

MH stigma prevalence

- **Q:** Over the past few decades in the US, do you think **public stigma** toward mental illness has been decreasing, increasing, or staying about the same?
- **A:** *It depends!* (Pescosolido et al., 2019, 2021; (Schomerus et al., 2022):
 - Depression stigma (**seems to be decreasing**)
 - Alcohol use disorder stigma (**seems to be increasing in some ways**)
 - Schizophrenia/psychosis stigma (**seems to be increasing in some ways**)

Schizophrenia stigma prevalence

- Perceived relationship between psychosis and violence is increasing (Pescosolido et al., 2019, 2021); continuum beliefs are decreasing (Schomerus et al., 2022)
- **Structural stigma: Schizophrenia more likely to be spared from financial cuts during the pandemic (v. pre-pandemic public attitudes). (Schomerus et al., 2022)*

MHTTC

Mental Health Technology Transfer Center Network
Funded by Substance Abuse and Mental Health Services Administration

Youth mental health stigma

Adolescent mental health (MH): a special context

- Approximately 50% of all MH conditions in the US begin in the teens, and 75% begin by the mid-20s (Kessler et al., 2007)
- Prevalence of adolescent MH conditions appears to be increasing (e.g., Mojtabai et al., 2016; Plemmons et al., 2017; Samji et al., 2021)

Public stigma *toward* youth

- The US general public stigmatizes youth with mental health problems:
 - Attributions of dangerousness and endorsements of coercion into treatment for youth with depression (Pescosolido et al., 2007)
 - Potentially *more* stigma (perceptions of violence) toward youth with mental illness v. adults with mental illness (depression) (Perry et al., 2007)
- However, there is generally poor mental health literacy in the public (only 59% adults can identify depression and 42% ADHD) (Pescosolido et al., 2008)

Stigma among youth

- **Labeling:** “nuts,” “disturbed,” “psycho,” “scary” - words commonly used to refer to someone with MI, 75% of labels were negative (among 14-year-olds in the UK; Rose et al, 2007). US 8th graders: “really weird,” “insane,” “special education” (Chandra & Minkovitz, 2007). “One slice short of a loaf” (UK, age 11-17; Bailey, 1999)
- **Knowledge:** Adolescents better at recognizing depression vignettes (40-70%) than psychosis (30%) or social anxiety (1-5%) (Coles et al., 2016; Wright et al, 2011). Still, many unaware of effective MH treatments and only 1/3 score above an 80% on a depression knowledge test (Hess et al., 2004; Goodwin et al., 2016).

Stigma among youth (continued)

- *“There is a new student in your class who just came from another school. You have heard that this student has a mental illness”* (US, age $M = 16.4$; Corrigan et al., 2005)
 - Adolescents tend to endorse fear and anger; more anger toward peers with ADHD > depression > “normal issues” (UK, age 15-16; O’Driscoll et al., 2012)
- Most US adolescents are willing to **talk** to a peer diagnosed with mental illness (78%); fewer are willing to **sit next to** (51%), **work on a class project** with (41%), or **go on a date** with (14%), the same person (Wahl et al., 2012)
- More “relationship social distance” endorsed toward peers with ADHD > depression > “normal issues” (O’Driscoll et al., 2012)

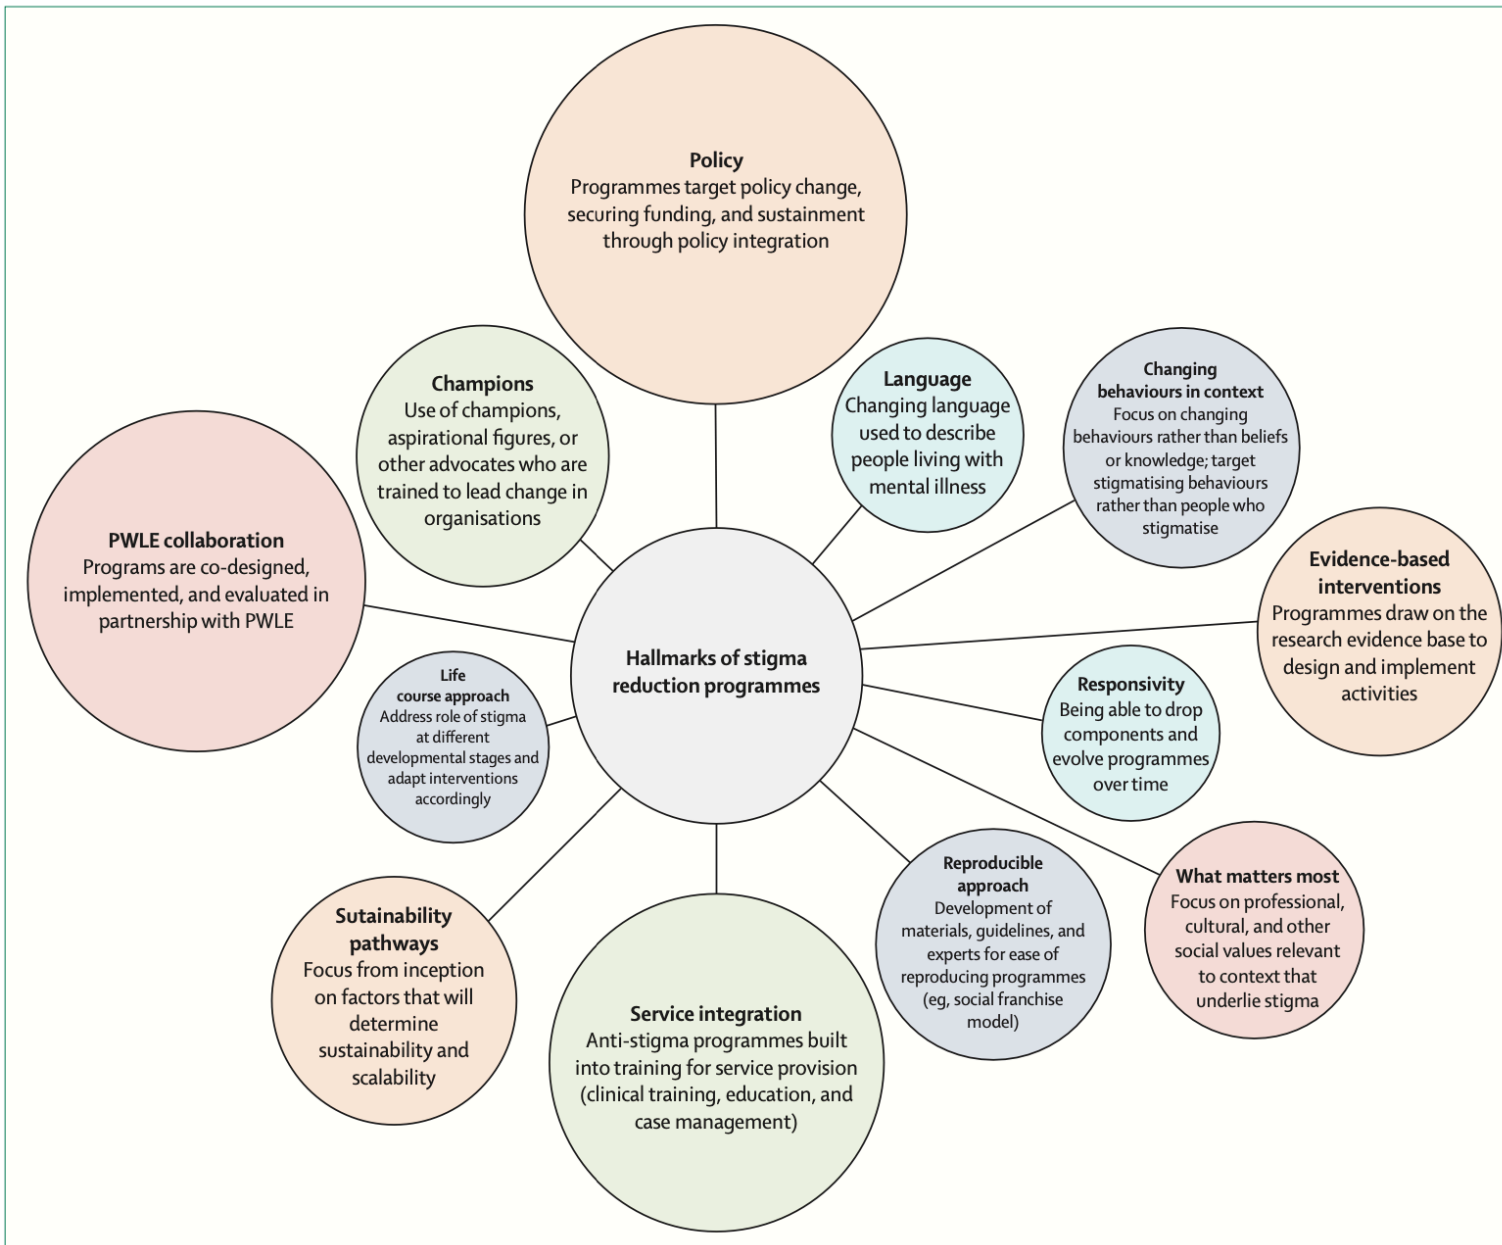

Figure 7: Key hallmarks of stigma reduction programmes

Balloon sizes represent the relative importance of key components and activities. PWLE=people with lived experience of mental health conditions.

Future work: Lived experience inclusion

(Thornicroft et al., 2022)

PWLE, local communities, and civil society

Goal: PWLE should be strongly supported to reduce stigma and discrimination

Recommendation 7: all current and future national government programmes for the reduction of mental health related stigma and discrimination should be led or co-led by PWLE, using the evidence-based principle of social contact

Recommendation 8: funded programmes to support people with lived experience should be provided in the following three categories: mutual help or peer support networks; integration of PWLE as providers of health and social services provision (eg, peer support workers); and service users receive support with disclosure decisions

By 2030, all national government programmes for the reduction of mental health related stigma and discrimination should be led or co-led by PWLE

By 2030, most programmes to support PWLE should report that all three types of support are being provided

WHO should add an additional question to the WHO Mental Health Atlas: are all national anti-stigma programmes led or co-led by PWLE? (Source: WHO Mental Health Atlas)

From 2023, the Global Mental Health Peer Network should conduct annual online surveys of programmes to support people with lived experience and assesses whether the programmes provide support in the three given categories

PWLE=people with lived experience of mental health conditions.

Early Career Service Grants

Joseph S. DeLuca, PhD

“Targeting Stigma and Race-Based Traumatic Stress in Early-Stage Psychosis Care via a Professional Development Program and Workgroup”

The proposed initiative’s goal is to improve the recognition of Race-Based Traumatic Stress and stigma among youth in the early stages of psychosis to help guide treatment and enhance engagement. The aim is to deliver a recorded 45–60-minute evidence based professional development presentation to early psychosis providers which will help enhance their ability and comfort to provide culturally responsive early psychosis services.

Upcoming Northwest MHTTC Webinars

What does lived experience really mean and why is it important?

Thursday May 18th — 10 - 11:30 AM Pacific

The phrase "lived experience" is widely used in behavioral health, but what does it really mean? Is lived experience a code word meaning "former mental patient"? Isn't all experience "lived experience" and therefore isn't "lived experience" redundant? Can a clinician have lived experience? In this 90-minute webinar, **Pat Deegan, PhD**, will explore the origins of "lived experience" in philosophy and its migration into behavioral health.

Blind spots in stigma research? Broadening our perspective on mental illness stigma by exploring ‘what matters most’ in modern Western societies

G. Schomerus¹  and M. C. Angermeyer²

¹Department of Psychiatry and Psychotherapy, University of Leipzig Medical Center, Leipzig, Germany and ²Center for Public Mental Health, Gösing am Wagram, Austria

Abstract

Aims. The theory of ‘what matters most’ (WMM) has been developed to understand differences in mental illness stigma between cultures, postulating that stigma becomes most pervasive in situations that matter most in a specific cultural context. The rise of populism in Western societies demonstrates that also within one cultural context, different values ‘matter most’ to different groups. We expand the WMM framework to explore the spectrum of stigma

Reducing Stigma in High School Students: A Cluster Randomized Controlled Trial of the National Alliance on Mental Illness' Ending the Silence Intervention

Joseph S. DeLuca
John Jay College of Criminal Justice, City University of New York (CUNY) and CUNY Graduate Center

Janet Tang, Sarah Zoubaa, and Brandon Dial
John Jay College of Criminal Justice, CUNY

Philip T. Yanos
John Jay College of Criminal Justice, CUNY and CUNY Graduate Center

Example youth program: *Ending the Silence*

- Developed by National Alliance on Mental Illness, the largest grassroots mental health nonprofit in the US (NAMI, 2013), in order to educate adolescents about mental health and reduce stigma
- Program structure:** two trained speakers; one class period (~50 minutes) in length; hopeful messages of recovery; connections to local mental health resources; warning signs; facts/statistics; how to help yourself/a peer
- “The goal of NAMI ETS** is to create a generation of students who are well-positioned to end the silence and stigma surrounding mental illness.”

Agenda

1. What is stigma?
2. How does mental health stigma impact people?
3. How do we conceptualize and study mental health stigma?
4. How can we combat stigma?
- 5. Summary & Q&A**

Summary

- Mental health stigma is widespread and detrimental to individuals
- Stigma operates on many levels: public... internalized/self... courtesy/associative... structural.... Etc.
- Education + contact-based programming (+ others) can help!
We have programs that work
- Attention to diversity and intersectionality is imperative
- Structural changes are also needed
