

Depression in Children and Teens

Signs & Symptoms

Sad mood/Hopelessness

Loss of interest in activities

Isolating/Withdrawing from family and friends

Decreased energy/Fatigue

Thinking about death, suicide

Feeling things are their fault

Sleep and/or appetite changes

Difficulty concentrating

Tearfulness/Frequent crying

Agitation/Irritability/Anger

Inability to envision a future

Declining grades

Physical complaints (headaches, stomach aches)

Alcohol/Drug use

While people used to think that depression only occurred in adults, we now know that children and adolescents can also experience depression. In fact, on average, approximately 3% of children ages 3-17 have a diagnosis of depression. That rate increases by 6-10% during adolescence^{1,2}. While many children experience down moods, the symptoms of depression should not be ignored.

Pointers for Caregivers

- Ask how your child is feeling or what is bothering them
- Listen to your child's concerns and provide support
- Encourage open and honest conversations
- Acknowledge their feelings without judgment
- Be with your child, whether doing an activity or just keeping them company
- Promote good self-care and support routine
- Reduce stress (especially for teens)
- Watch for signs of suicide
- Eliminate access to medications, weapons, and substances
- Create a safety plan, if needed

Supporting a Child in the Moment

Create spaces for connection

Provide healthy meals

Encourage ample amounts of sleep

Keep them moving

Long-Term Help

- Signs and symptoms of depression go on for 2 weeks or more
- Behavior is different from their "usual self"
- Depression interferes with daily activities
- Child talks, jokes, writes about suicide
- Child makes statements like, "I can't go on", "There's no way out"
